

# Drayage Presentation

Safely Hauling AVC Advantages

Trucks and trailers must be of sufficient weight and load-bearing ability to safely carry the voting machines, and must be enclosed trucks or enclosed trailers.

A lift gate is recommended to load machines in order to reduce damage to the leg weldments of the machines.

Once a machine is positioned in the vehicle/trailer, the wheels must be locked in order to prevent movement during travel.

All voting machines shall be loaded, blocked and strapped on the trucks at all times during drayage to the satisfaction of the Secretary of State or his designated representative.

***Proper moving  
straps must be used.  
Rope or twine of any  
strength shall not be  
used.***

Each and every row of machines loaded must be secured with proper moving straps.
